

WCS Platform

iOS Learning Application

20-Page Feature & Function Guide

For Investors and Consumers

World Class Scholars · Version 1.0 (Build 11) · May 31, 2026
Bundle ID: wcs.WCS-Platform · Platform: iPhone & iPad (SwiftUI)

This document describes the product capabilities, user journeys, technology foundations, and commercial model of the WCS Platform native iOS application. It is intended for due diligence, investor briefings, consumer transparency, and App Store marketing alignment.

Executive Summary

WCS Platform is a native iOS education application that delivers structured learning programs for individual learners, care-sector professionals, and organizational cohorts. The product combines course discovery, enrollment, sequenced modules, video lessons, quizzes, assignments, progress tracking, and community discussion in a single SwiftUI experience.

For **consumers**, the app offers a trustworthy catalog of programs with clear progress signals and accessible support contacts. For **investors**, WCS pairs a scalable content pipeline (AI-assisted authoring and video generation) with enterprise-ready procurement paths and compliance-first external billing—without consumer In-App Purchase complexity in the current App Store build.

The application is production-hardened with privacy manifests, CI quality gates, simulator and device UI tests, and documented reviewer paths for Apple App Store compliance.

Product Vision & Mission

World Class Scholars exists to make high-quality, structured learning available to learners who need clarity—not clutter. The iOS app expresses that mission through:

- **Open discovery** of programs with transparent structure (modules, lessons, assessments).
- **Trust surfaces** on the Discover tab (course designer contact, learner stories, support email).
- **Progress you can trust** via enrollment state, lesson completion, and quiz outcomes.
- **Companion media** where appropriate (lesson video, optional YouTube enrichment).

Unlike generic video libraries, WCS is a *learning operating system*: content is organized, assessed, and discussed—not merely streamed. The admin-facing AI Course Studio (restricted role) accelerates curriculum authoring for institutions that license the platform.

Who the App Serves

Individual learners browse programs, enroll in free-audit or premium tiers, complete lessons and quizzes, and participate in cohort discussions.

Care and creative-arts professionals benefit from specialized programs (e.g., dementia-inclusive creative learning) with practical modules and reflective discussion.

Organizations & investors (B2B) use clearly labeled external procurement links for seat licensing and enterprise contracts—separate from consumer app flows.

Administrators & instructional designers access AI-assisted draft generation, scene-based video pipelines, and publish workflows (admin-only surfaces not required for standard App Review).

Navigation Architecture

The app uses a five-tab **TabView** (iOS 18+):

Discover — featured programs, resume learning, trust cluster, support.

Programs — full course catalog and search.

Discussion — community threads tied to learning cohorts.

Profile — identity, enrollments, membership & billing, settings.

About — platform mission, policies, institutional context.

Each tab is wrapped in a **NavigationStack** for deep linking into course detail, lessons, quizzes, and admin tools. Brand accent color (#1F4E79) and rounded typography reinforce a professional, accessible edtech aesthetic consistent across iPhone and iPad layouts.

Discover Tab — Featured Learning

The Discover home screen welcomes learners with “**Open learning, WCS-owned.**” Featured program cards scroll horizontally for quick entry into high-priority courses. Enrolled users see a **Resume learning** strip linking directly to in-progress programs.

The **Course designer contact card** surfaces Dr Christopher Appiah-Thompson with one-tap email to activated support addresses (primary: christopher.appiahthompson@myworldclass.org; secondary: chrsappiah@gmail.com). Learner testimonial pages provide social proof (placeholder content flagged for marketing replacement before campaigns).

Capability rows summarize platform strengths: structured modules, graded assessments, video lessons, and offline-tolerant networking where configured.

Programs Tab — Course Catalog

The Programs tab presents the full **course catalog** as browsable cards with titles, descriptions, module counts, and enrollment status. Learners can search and filter to find programs aligned with their goals.

Each course maps to a structured backend model: goals, outcomes, modules, lessons, quizzes, and assignments. Free-audit tiers allow exploration; premium tiers gate advanced lessons per server-side entitlement records (no StoreKit in build 11).

Navigation to **Course Detail** reveals syllabus structure, instructor context, and enroll actions—forming the primary conversion funnel for individual learners.

Course Detail & Enrollment

Course Detail consolidates marketing copy, learning outcomes, module syllabus, and enrollment state. Tapping **Enroll** registers the learner and unlocks module navigation according to plan tier.

The screen communicates expectations: lesson types (video, reading, quiz), estimated effort, and discussion participation. Progress rings or completion chips update as learners advance.

Gating logic respects **free audit vs. premium** boundaries without in-app card capture; upgrade paths route to Membership & billing with labeled external checkout when configured.

Modules, Lessons & Sequencing

Within a course, **modules** group related lessons into pedagogical units—mirroring textbook chapters but optimized for mobile consumption. Lessons declare type: video playback, text content, quiz checkpoint, or assignment submission.

Sequencing rules prevent skipping required assessments where policy demands mastery checks. LessonVideoPlaybackPolicy governs autoplay, background audio, and accessibility captions where available.

Module-level **video discovery** can attach companion YouTube educational clips derived from lesson scripts (API-key gated; graceful fallback when unavailable).

Video Lesson Playback

Video lessons render in a dedicated player surface with standard transport controls, lesson title, and navigation to adjacent lessons. Assets may originate from:

- Cached AI-generated lesson MP4s (admin pipeline)
- Remote URLs via Supabase/OpenAI orchestration when live stack enabled
- On-device AVFoundation image-sequence renders for demos and tests
- Manual external uploads validated for format and safety

LessonVideoWithYouTubeBackupView offers companion clips without replacing first-party instructional video. Playback respects network resilience (retries, circuit breaker, stale cache).

Quizzes & Assessments

Quizzes validate comprehension through multiple-choice and structured prompts tied to lesson objectives. The Quiz flow includes start screen, per-question navigation, and completion summary with score feedback.

QuizViewModel synchronizes state with MockLearningStore / production APIs. Results contribute to profile progress metrics and may unlock subsequent modules.

Assessment checkpoints embedded in **scene-based video plans** (instructional design layer) align video content with formative checks—supporting mastery-based pathways for institutional buyers.

Assignments & Progress Tracking

Assignments extend beyond auto-graded quizzes: learners may submit reflective responses or evidence of practice (configuration-dependent). Instructors or admins review submissions outside the consumer critical path.

Progress tracking aggregates lesson completions, quiz scores, and enrollment timestamps on the Profile and Resume cards. Telemetry uses structured event names without logging payment data.

The design prioritizes *visible progress*—learners always know what to do next, reducing dropout common in unstructured MOOC experiences.

Discussion & Community

The Discussion tab hosts cohort conversations: threaded posts, replies, and compose actions. MockDiscussionStore powers demo mode; production connects to moderated community APIs.

Discussion reinforces social learning—particularly valuable for care-sector cohorts reflecting on practice. Notifications (Core/Notifications) can alert users to replies when push is enabled and permitted.

Community guidelines and reporting flows align with App Store safety expectations; admin tools can curate or remove content at the API layer.

Profile & Learner Identity

Profile centralizes the learner identity: display name, avatar, enrollment list, and shortcuts to Membership & billing and settings. Premium status reflects **server-side subscription records** (StoreKit removed in build 11).

Sign-in state bootstraps on launch via AppViewModel. Keychain and UserDefaults persist non-sensitive preferences under declared privacy manifest reasons.

Profile is the anchor for **reviewer validation** of plan tiers and external upgrade links.

Membership & Billing (Build 11)

Build **1.0 (11)** removes Apple In-App Purchase entirely to resolve Guideline 3.1.1. The Membership screen shows:

- **Plan overview** (Free Audit vs. Pro descriptions)
- **Upgrade to Premium** — optional hosted Stripe checkout URL (env-configured, external)
- **Organization & investor procurement** — B2B links, clearly labeled
- **Admin payouts** — enterprise settlement (admin-only)

No consumer card entry in-app. No StoreKit product IDs. Premium gating uses backend entitlements. Debug-only mock premium toggles are excluded from Release builds.

Admin AI Course Studio

Restricted to admin roles, the **Admin Course Creator** studio generates course drafts with AI: goals, modules, lessons, reasoning traces, and video generation jobs.

Features include bulk video orchestration, per-scene pipeline controls, instructional text-to-video render, hybrid Apple Foundation Models + network fallback planning, and publish-to-catalog actions.

Real-time progress UI surfaces job states (queued, rendering, complete, failed). Reviewers may skip this surface; it is not required for standard consumer validation.

Video & AI Pipeline (Technical)

The lesson video stack includes:

- **Structured scene plans** (conditioning, motion, camera, backend model hints)
- **HybridLessonVideoOrchestrator** — Apple FM when iOS 26+ else network heuristic
- **InstructionalLessonVideoPipeline** — text → plan → render → compose MP4
- **Supabase BFF** for OpenAI Sora when live stack enabled
- **AVFoundation** image-sequence fallback for CI and offline demos

WCSBackendStackCoordinator probes Supabase, Cloudflare, and iCloud backup tiers for health display.

Privacy, Security & Compliance

PrivacyInfo.xcprivacy declares required reason APIs. Outbound URLs pass allowlist validation in CI. Crossref and YouTube enrichment use query metadata—not learner PII.

Support contacts are activated in Info.plist and validated by validate-support-contacts.sh. External payment links are user-initiated and labeled. Encryption export compliance uses standard iOS TLS.

GitHub Actions enforces build, unit tests, UI smoke, E2E gates, and support-contact validation before merge to main.

About Tab & Institutional Trust

The About tab presents World Class Scholars mission, platform principles, and links to policies. Support <mailto:> links use activated emails for learner and reviewer confidence.

Home trust cluster and About content align for consistent institutional narrative—critical for dementia-care and creative-arts programs where credibility affects enrollment.

Investors should note: trust UI is first-class, not an afterthought—reducing support burden and App Store clarification cycles.

Investment Thesis & Roadmap

Why invest in WCS Platform iOS?

1. **Differentiated OS-layer** — structured learning + AI authoring, not a thin content wrapper.
2. **Multi-tier monetization** — individual premium (external/hosted), enterprise seats, investor procurement.
3. **Defensible pipeline** — scene-based video orchestration with on-device and cloud backends.
4. **Production discipline** — CI gates, ARC Shield review artifacts, documented reviewer paths.
5. **Category expertise** — dementia-inclusive creative learning vertical with pilot social proof.

Roadmap highlights: deeper CMS integration, live cohort scheduling, expanded language support, Apple Intelligence adoption on iOS 26+ devices, and international B2B partnerships.
